1. Claims 1-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lingier et al. (US2004/0005417) in view of Fukuda et al. (6,677,389).

Lingier et al. disclose an ink jet recording material including a paper or film substrate and an ink receiving layer containing binder and cationic inorganic particles [0029,0035, 0038-0039]. The cationic particles may be silica that has been modified with a cationic resin [0045, 0047, 0048]. The resins may have amino groups or quaternary ammonium groups. The reference discusses formation of a glossy ink receiving layer [0051]. The reference also discloses inclusion a zirconium complexes and plasticizers as known additives [0060,0062]. BACOTE 20®, referred to in the reference, is a zirconium ammonium carbonate salt.

The secondary reference teaches formation of a cationized silica dispersion for use in making ink jet recording paper and other materials (see the abstract). To form the cationized silica, resins including polyethyleneimine and polyvinylamine may be used to treat the silica (see col. 3, lines 32-50). Based upon the disclosure of the primary reference to include silica that has been made cationic by treatment with an organic compound having an amino group or a quaternary ammonium group, it would have been obvious to one of ordinary skill in the art to treat the silica of the primary reference with one of the specific cationic amino group containing resins disclosed for this purpose in the secondary reference in order to render the silica of the primary reference cationic.
